

## └ The note directive

This is an example.

This is an example of that.

Look at the previous slide for an example of that.

## └ Notes as containers

Notes as containers

The custom `\r2b` directives won't be recognised by any writer other than `rst2beamer`. Therefore, we allow certain containers (which most other writers should recognise and at worst ignore) to act like notes.  
Any container with the name `'\r2b_note'` or `'\r2b-note'` will be handled like the notes directive.

Compatibility is important

Important: I must find out why the container names are being munged.
